

CLAIMS

Please amend the claims as follows:

1. (Presently Amended) A method for management and collection of impulse pay-per-view (IPPV) data in a smart card coupled to a digital television terminal, wherein the IPPV data comprises credit/debit data and wherein the method comprises comprising:

 sending security information from a headend controller to a smart card via the terminal;

 computing smart card authentication data based on said security information;

 polling the terminal by the headend controller to retrieve said authentication data and current IPPV data;

 validating said current IPPV data at said controller based on said authentication data;

 calculating an updated IPPV data based upon at least the current IPPV data by the controller by calculating a new credit/debit data; and

 sending the updated IPPV data from said controller to said smart card via said terminal.

2. (Previously presented) The method in accordance with claim 1, wherein said authentication data is derived from at least one of:

 said security information,

 said current IPPV data, and

 purchase record information.

3. (Cancelled)

4. (Presently amended) The method in accordance with claim 1, wherein said smart card is one of:

- a newly issued smart card with zero IPPV data values,
- a re-issued smart card with zero IPPV data values, and
- a re-issued smart card with non-zero IPPV data values.

5. (Previously presented) The method in accordance with claim 1, further comprising: temporarily disabling IPPV capabilities at the terminal until updated IPPV data is received by the terminal.

6. (Presently amended) The method in accordance with claim 1, further comprising:
comparing credit/debit status of the updated IPPV data to an IPPV purchase amount to determine whether to allow or disallow an IPPV purchase.

7. (Previously presented) The method in accordance with claim 1, further comprising:
storing said current IPPV data at said terminal.

8. (Previously Presented) The method in accordance with claim 1, further comprising:
reporting previously stored IPPV data values from a prior smart card associated with said terminal from said terminal to said headend.

9. (Previously presented) The method in accordance with claim 1, further comprising:

constructing a purchase report back message at said terminal at the time of an initial IPPV purchase.

10. (Previously presented) The method in accordance with claim 9, further comprising:

updating said purchase report back message at the time of each subsequent IPPV purchase after said initial purchase.

11. (Previously presented) The method in accordance with claim 10, further comprising:

periodically polling the terminal by the headend controller to retrieve the report back message.

12. (Previously presented) The method in accordance with claim 11, further comprising:

overwriting said purchase report back message with a new purchase report back message at the time of a first IPPV purchase occurring after said polling.

13. (Previously presented) The method in accordance with claim 9, further comprising:

storing said purchase report back message at said terminal.

14. (Previously presented) The method in accordance with claim 9, wherein said

purchase report back message includes at least one of said current IPPV data, IPPV purchase data, and said authentication data.

15. (Presently amended) The system for management and collection of impulse pay-per-view (IPPV) data wherein the IPPV data comprises credit/debit data, the system comprising:

a headend controller;
a smart card enabled digital television terminal in communication with said controller via a network; and

a smart card operatively associated with said terminal;
wherein:

said controller sends security information to the smart card via the terminal;
authentication data based on said security information is computed by said smart card;
the terminal is polled by the headend controller to retrieve said authentication data and current IPPV data;
said current IPPV data is validated by the controller based on said authentication data; ~~and~~
calculating an updated IPPV data based upon at least the current IPPV data by the controller by calculating a new credit/debit data; and
updated IPPV data is sent from said controller to said smart card via said terminal.

16. (Presently amended) The system in accordance with claim 15, wherein said authentication data is derived from at least one of:

said security information,
said IPPV data, and
purchase record information.

17. (Cancelled)

18. (Presently amended) The system in accordance with claim 15, wherein said smart card is one of:

a newly issued smart card with zero IPPV data values,
a re-issued smart card with zero IPPV data values, and
a re-issued smart card with non-zero IPPV data values.

19. (Previously presented) The system in accordance with claim 15, further comprising:
temporarily disabling IPPV capabilities at the terminal until updated IPPV data is received by the terminal.

20. (Presently amended) The system in accordance with claim 15, wherein:

the new credit/debit data of the updated IPPV data is compared to an IPPV purchase amount to determine whether to allow or disallow an IPPV purchase.

21. (Previously presented) The system in accordance with claim 15, further comprising:

a storage device associated with said terminal for storing said current IPPV data at said terminal.

22. (Previously presented) The system in accordance with claim 15, wherein:
previously stored IPPV data values from a prior smart card associated with said terminal are reported from said terminal to said headend.

23. (Previously presented) The system in accordance with claim 15, wherein:
a purchase report back message is constructed at said terminal at the time of an initial IPPV purchase.

24. (Previously presented) The system in accordance with claim 23, wherein said purchase report back message is updated at the time of each subsequent IPPV purchase after said initial purchase.

25. (Previously presented) The system in accordance with claim 24, wherein:
the headend controller periodically polls the terminal to retrieve the report back message.

26. (Previously presented) The system in accordance with claim 25, wherein said purchase report back message is overwritten with a new purchase report back message at the time of a first IPPV purchase occurring after said polling.

27. (Previously presented) The system in accordance with claim 23, wherein said purchase report back is stored at said terminal.

28. (Previously presented) The system in accordance with claim 23, wherein said purchase report back message includes at least one of said current IPPV data, IPPV purchase data, and said authentication data.

29-36. (Cancelled)
